

Mini screw blocking system

The mini screw blocking system from ML Implant system is ideal for the resolution of micro screwed protheses or the making up of hybrid protheses of double structure

The images correspond to a case in which the mini screw blocking system was used together with the mini abutment system.

The castable hub, joint to the emergent (1º structure), lodges the hub with the screw for the conical mini screw [A][B][E].

The castable seating lodges the conical mini screw, which will allow the fixing of the emergent structure [B][C][E].
